Neutron matter can be modeled as a periodic system of N neutrons interacting by an **Hamiltonian** of the form:

$$H = -\frac{\hbar^2}{2m} \sum_i \nabla_i^2 + \sum_{i<j} v_{ij} + \sum_{i<j<k} V_{ijk} + \dots .$$

In our calculations we used two kinds of potentials:

- **phenomenological** AV8'+UIX.
- **chiral EFT** N2LO local (D2,E1 and with $R_0=R3N=1.0$ fm) [Lynn et al. PRL 116, 062501 (2016)].

Conclusions

The interaction part of the EDF is assumed to be of the form:

$$\epsilon_V(\rho, m) = \epsilon_0(\rho) + m^2 [\epsilon_1(\rho) - \epsilon_0(\rho)] ,$$

where:

$$\epsilon_q(\rho) = \epsilon_q^0 + a_q(\rho - \rho_0) + b_q(\rho - \rho_0)^2 + c_q(\rho - \rho_0)^3$$

The saturation density is assumed to be $\rho_0 = 0.16 \text{ fm}^{-3}$.

This parametrization reproduces very well the AFDMC calculations in a wide range of density ρ (from $\rho_0/2$ to $3\rho_0$) and for both $m = 0, 1$.

We are interested in studying the **density response** of the system. For nucleons the response can be splitted in different channels, described by the following operators:

$$O_F = \sum_i O_F(i) = \sum_i \tau_i^\pm e^{i\mathbf{q}\cdot\mathbf{r}_i} \text{ "Fermi"}$$

$$O_{GT} = g_A \sum_i \mathbf{O}(i) = \sum_i \sigma_i \tau_i^\pm e^{i\mathbf{q}\cdot\mathbf{r}_i} \text{ "Gamow-Teller"}$$

$$O_{NV} = \sum_i O_{NV}(i) \text{ "Neutral-vector"}$$

$$= \sum_i \left[-\sin^2 \theta_W + \frac{1}{2}(1 - 2\sin^2 \theta_W) \tau_i^z \right] e^{i\mathbf{q}\cdot\mathbf{r}_i}$$

$$O_{NA} = g_A \sum_i \mathbf{O}_{NA}(i) = g_A \sum_i \frac{1}{2} \tau_i^z \sigma_i e^{i\mathbf{q}\cdot\mathbf{r}_i} \text{ "Neutral-axial-vector"}$$

Neutron
matter

Derivation of
the density
functional

Response
function in
neutron
matter and
neutrino
physics

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

The WS Lagrangian couples neutrinos to *density* and *spin density* fluctuations of neutrons.

In the **non-relativistic limit** the baryonic current can be approximated by:

$$\bar{\psi}_n(x)\gamma^\mu(1 - C_A\gamma_5)\psi_n \sim \psi_n^\dagger(x)\psi_n(x)\delta_0^\mu - C_A\psi_n^\dagger(x)\sigma_i\psi_n(x)\delta_i^\mu.$$

We have two contribution a **density fluctuation** and a **spin-density** fluctuation operators.

The scattering rate from a system of neutrons of a neutrino with 4-momentum $q^\mu \equiv (q^0, \vec{q})$ can be computed from the Fermi golden rule, averaging on the initial (neutron and/or proton) states and summing over all the final states.

neutrino
physics

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

The result gives the *neutrino scattering rate*. For a neutrino of incident energy E , the contribution to the scattering rate σ in a given channel can be written as:

$$\sigma = \frac{G^2}{2} \frac{1}{E} \int dq \int d\omega (E - \omega) q \left(1 + \frac{E^2 + (E - \omega)^2 - q^2}{2E(E - \omega)} \right) S(q, \omega),$$

where $S(q, \omega)$ is the *dynamical structure factor (DSF)* for the excitation operators describing the process. These in turn can be written as a combination of the DSF relative to a *density*, and *spin-density* excitations.

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

Following the *Kohn-Sham* method, we introduce a **Local Spin Density Approximation (LSDA)** for the homogeneous neutron matter defining the **energy functional** as:

$$E(\rho, m) = T_0(\rho, m) + \int \epsilon_V(\rho, m) \rho \, d\mathbf{r},$$

where $T_0(\rho, m)$ is the kinetic energy of the *non interacting* system with density $\rho = \rho_{n\uparrow} + \rho_{n\downarrow}$, and spin polarization $m = \rho_1/\rho$ with $\rho_1 = \rho_{n\uparrow} - \rho_{n\downarrow}$.

The Hohenberg-Kohn theorem provides a *variational principle on the energy-density functional*.

Longitudinal channel

Since we are interested in homogeneous systems, the solutions of the KS-equations have the form (for both spin up and spin down):

$$\rho_n(\mathbf{r}, t) = \rho_n + \delta\rho_n(\mathbf{r}, t),$$

where:

$$\delta\rho_n(\mathbf{r}, t) = \delta\rho_n \left[e^{i(\mathbf{q}\cdot\mathbf{r}-\omega t)} + e^{-i(\mathbf{q}\cdot\mathbf{r}-\omega t)} \right].$$

The quantities $\delta\rho_n$ have to be determined from the KS equations. In order to determine $\delta\rho_{n\uparrow}$ and $\delta\rho_{n\downarrow}$, we insert $\rho_{n\uparrow}(\mathbf{r}, t), \rho_{n\downarrow}(\mathbf{r}, t)$ in the KS equations, and linearize. After this procedure one obtains:

$$\begin{aligned}\lambda\chi^{n\uparrow}(\mathbf{q}, \omega) &= \lambda'_{n\uparrow} \chi_0^{n\uparrow}(\mathbf{q}, \omega) \\ \lambda\chi^{n\downarrow}(\mathbf{q}, \omega) &= \lambda'_{n\downarrow} \chi_0^{n\downarrow}(\mathbf{q}, \omega)\end{aligned}$$

Longitudinal channel

The previous two equations, together with the definition of the linear response function, allow for solving for $\chi^{n\uparrow}$ and $\chi^{n\downarrow}$, given χ_0 (longitudinal response function of the free Fermi gas). Summing and subtracting $\chi^{n\uparrow}$ and $\chi^{n\downarrow}$ we obtain the density-density and vector-density/vector-density response functions **for arbitrary spin polarization**.

TDLSDA longitudinal response functions (scalar and vector)

$$\frac{\chi^s(q, \omega)}{V} = \frac{\frac{\chi_0^{n\uparrow}}{V} [1 - (V_{n\downarrow n\downarrow} - V_{n\uparrow n\downarrow}) \frac{\chi_0^{n\downarrow}}{V}] + \frac{\chi_0^{n\downarrow}}{V} [1 - (V_{n\uparrow n\uparrow} - V_{n\downarrow n\uparrow}) \frac{\chi_0^{n\uparrow}}{V}]}{(1 - V_{n\downarrow n\downarrow} \frac{\chi_0^{n\downarrow}}{V})(1 - V_{n\uparrow n\uparrow} \frac{\chi_0^{n\uparrow}}{V}) - V_{n\uparrow n\downarrow} \frac{\chi_0^{n\uparrow}}{V} V_{n\downarrow n\uparrow} \frac{\chi_0^{n\downarrow}}{V}},$$

$$\frac{\chi^v(q, \omega)}{V} = \frac{\frac{\chi_0^{n\uparrow}}{V} [1 - (V_{n\downarrow n\downarrow} + V_{n\uparrow n\downarrow}) \frac{\chi_0^{n\downarrow}}{V}] + \frac{\chi_0^{n\downarrow}}{V} [1 - (V_{n\uparrow n\uparrow} + V_{n\downarrow n\uparrow}) \frac{\chi_0^{n\uparrow}}{V}]}{(1 - V_{n\downarrow n\downarrow} \frac{\chi_0^{n\downarrow}}{V})(1 - V_{n\uparrow n\uparrow} \frac{\chi_0^{n\uparrow}}{V}) - V_{n\uparrow n\downarrow} \frac{\chi_0^{n\uparrow}}{V} V_{n\downarrow n\uparrow} \frac{\chi_0^{n\downarrow}}{V}}.$$

Transverse channel

Luca Riz

Neutron
matter

Derivation of
the density
functional

Response
function in
neutron
matter and
neutrino
physics

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

A similar derivation can be done for the transverse channel.

In this case the LSDA-KS equations are:

$$\left[-\frac{1}{2}\nabla_{\mathbf{r}}^2 + \frac{1}{2}\omega_L\sigma_z + v(\mathbf{r}) + w(\mathbf{r})\sigma_z \right] \varphi_i^\sigma(\mathbf{r}) = \varepsilon_{i,\tau} \varphi_i^\sigma(\mathbf{r})$$

The second term in the l.h.s is an **effective vector potential** accounting for the equilibrium spin polarization (due to the presence of strong magnetic fields). The parameter ω_L can be related to spin imbalance by imposing that the variation of the LSDA energy with respect to m be zero.

Transverse channel

ECT*

Neutron
matter

Derivation of
the density
functional

Response
function in
neutron
matter and
neutrino
physics

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

The resulting interaction (single particle) Hamiltonian, when a density fluctuation is considered, becomes:

$$H_{\text{int}} \sim \sigma^- e^{i\mathbf{q}\cdot\mathbf{r}-i\omega t} + \sigma^+ e^{-i\mathbf{q}\cdot\mathbf{r}+i\omega t}.$$

The response function is defined as the difference of the response relative σ^- and σ^+ and, eventually the final result for the response function is:

$$\frac{\chi_t(\mathbf{q}, \omega)}{V} = \frac{\chi_t^0(\mathbf{q}, \omega)}{1 - \frac{2}{V} \mathcal{W}(\rho, m) \chi_t^0(\mathbf{q}, \omega)},$$

where the $\chi_t^0(\mathbf{q}, \omega)$ is the transverse response of the free Fermi gas.

Excitation strengths and sum rules

Evaluation of
the response
function:
TDLSDA

Numerical
results

Conclusions

- From the response function it is possible to determine the **dynamic structure factor** via the relation:

$$S^{s,v}(q, \omega) = -\frac{1}{\pi} \Im m[\chi^{s,v}]$$

- From the DSF it is also possible to compute the **energy weighted sum rules**:

$$m_k^{s,v} = \int_0^\infty d\omega \omega^k S^{s,v}(q, \omega) = \sum_n \omega_{no}^k |\langle 0 | F^{s,v} | n \rangle|^2$$

In particular the ratio m_{-1}/m_0 gives the *compressibility* of the system.

- The poles of $\chi(q, \omega)$ give the spectrum and the dispersion $\omega(q)$ of the **collective excitations**, for which we can also evaluate the **strength**.

Neutrino mean free path

As previously discussed, the **scattering rate** of neutrinos can be obtained by computing the integral:

$$\sigma = \frac{G^2}{2} \frac{1}{E} \int dq \int d\omega (E - \omega) q \left(1 + \frac{E^2 + (E - \omega)^2 - q^2}{2E(E - \omega)} \right) S(q, \omega)$$

The **neutrino mean free path** λ is related to σ by the following relation:

$$\lambda = \frac{1}{\sigma \rho}$$

The scattering rate is made up of two contributions:

- Contribution from the particle-hole excitations
- Contribution from the collective mode

Kinematic limits

The transferred momentum must satisfy the following inequality:

$$|\omega| < cq < |\omega - 2ck|$$

This implies that:

$$\omega < c(2k - q)$$

This represents the integration bound, that has to be intersected with the limits coming from $S(q, \omega)$.

This holds for **non-degenerate** neutrinos.

TDLSDA

Numerical
results

Conclusions

Neutrino mean free path (transverse)

It is interesting to look at the contribution of the collective modes.

Conclusions

Neutrino mean free path (transverse)

Ratio of the NMFP in an interacting neutron matter and in a free Fermi gas at density $\rho/\rho_0 = 1$.

Numerical
results

Conclusions

- We computed the response function in the longitudinal and transverse channel in pure neutron matter, starting from accurate QMC calculations of (spin polarized) neutron matter.
- The time dependent local density approximation was successfully applied to estimate the response function of arbitrary spin polarized neutron matter.
- We computed the contribution of transverse channel to the suppression of the neutrino mean free path in neutron matter (longitudinal channels is in progress). At the NS core conditions matter is essentially transparent, while relevant effects could be seen in the NS crust.
